Advanced Electroactive Polymers for Energy Storage and Conversion

*X. Chen, T. Zhang, W. Y. Zhu, Q. M. Zhang

This poster will present recent advances and breakthroughs in the advanced electroactive polymers for energy storage and conversion. This includes giant electrocaloric response at ultralow electric field and resulting EC coolers, high electromechanical actuation and coupling, and dilute nanocomposites in which nanofillers at ultralow volume loading generate large dielectric enhancement in polymers.
